SECOND YEAR (SY)

DIPLOMA IN COMPUTER ENGINEERING

SCHEME: I

SEMESTER: IV

NAME OF SUBJECT: DATA COMMUNICATION AND COMPUTER NETWORK

SUBJECT CODE: 22414

MSBTE QUESTION PAPERS & MODEL ANSWERS

1. MSBTE SUMMER -19 EXAMINATION

2. MSBTE WINTER -19 EXAMINATION

22414

21819

3 Hours / 70 Marks

Seat No.

--	--	--	--	--	--	--	--

- Instructions* – (1) All Questions are *Compulsory*.
(2) Answer each next main Question on a new page.
(3) Illustrate your answers with neat sketches wherever necessary.
(4) Figures to the right indicate full marks.
(5) Mobile Phone, Pager and any other Electronic Communication devices are not permissible in Examination Hall.

Marks

- 1. Attempt any FIVE of the following:** **10**
- a) Define Computer Network and state its types.
 - b) State various Computer Network applications.
 - c) List any four Unguided Transmission Media.
 - d) State types of Errors.
 - e) List IEEE 802 X standards for networks.
 - f) Compare Router and Repeater.
 - g) State functions of Network layer.
- 2. Attempt any THREE of the following:** **12**
- a) Classify the network based on geographical area and transmission technology.
 - b) Draw structural diagram of fiber optic cable and write its functions.
 - c) Describe various IEEE standards for network topologies.
 - d) Draw and explain layered architecture of OSI model.

P.T.O.

- 3. Attempt any THREE of the following:** **12**
- a) What advantages does TDM have over FDM in a circuit switched Network.
 - b) Compare Analog and Digital signals.
 - c) With suitable diagram describe:
 - (i) STAR topology
 - (ii) RING topology
 - d) Describe major functions of network layer in TCP/IP protocol suite.
- 4. Attempt any THREE of the following:** **12**
- a) Draw and describe architecture for network using tree topology for an office in 3-storey's building.
 - b) Describe functions of physical layer and data link layer of OSI model.
 - c) Differentiate between FDM and TDM.
 - d) Describe types of IP address classes.
 - e) Design suitable network layout for an organization with five department (ten users each)
- 5. Attempt any TWO of the following:** **12**
- a) Describe the process of data communication in various modes.
 - b) Why is circuit switching preferred over packet switching in voice communication?
 - c) Your company has the network id 165.130.0.0. You are responsible for creating subnets on the network, and each subnet must provide at least 1000 host ids.
What subnet mask meets the requirement for the minimum number of host ids and provides the highest number of subnets?

6. Attempt any TWO of the following:**12**

- a) A system uses CRC on a block of 8 bytes. How many redundant bits are sent per block? What is the ratio of useful bits to the total bits?
 - b) Describe the process of DHCP server configuration.
 - c) What is the MAC protocol used in Token Ring LAN's? What happens if the token is lost?
-

SUMMER – 19 EXAMINATION

Subject Name: Data Communication Network Model Answer

Subject Code: 22414

Important Instructions to examiners:

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills).
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.

Q. No.	Sub Q. N.	Answer	Marking Scheme
Q.1		Attempt any five of the following:	10 M
	a	Define Computer Network and state its types.	2 M
	Ans	Definition: A computer network is a group of computer systems and other computing hardware devices that are linked together through communication channels to facilitate communication and resource sharing among a wide range of users. Types of Computer Networks: <ul style="list-style-type: none">• Local Area Networks (LAN)• Personal Area Networks (PAN)• Home Area Networks (HAN)• Wide Area Networks (WAN)• Metropolitan Area Networks (MAN)• The Internet	1 M definition, 1M for types
	b	State various Computer Network applications	2 M
	Ans	Computer Network Applications: 1. File Sharing	Any Four- 1/2

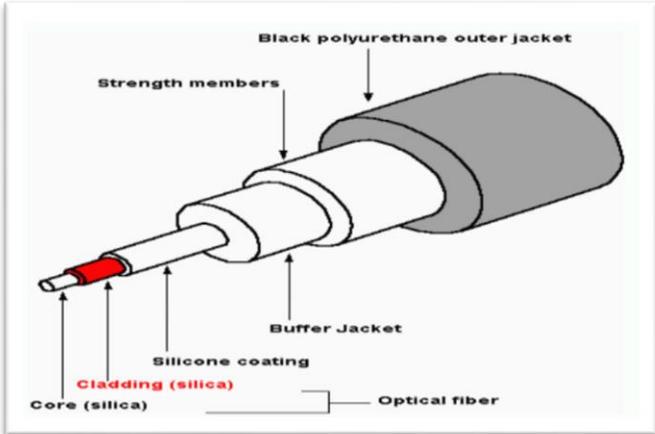

MAHARASHTRA STATE BOARD OF TECHNICAL EDUCATION

 (ISO/IEC - 27001 - 2013 Certified)

	g	State functions of Network layer			2M
	Ans	Functions of network layer: <ol style="list-style-type: none"> 1. logical addressing 2. Routing. 3. Congestion control 4. Accounting and billing 5. Address transformation 6. Source host to destination host error free delivery of packet. 			1/2M each
	Q2	Attempt any THREE of the following :			12 M
	a	Classify the network based on geographical area and transmission technology			4 M
	Ans	Classification of networks based on geography: LAN - Local Area Network MAN - Metropolitan Area Network WAN - Wide Area Network CAN - Campus Area Network PAN - Personal Area Network LAN: LAN is local area network. LAN is privately-owned networks covering a small geographic area(less than 1 km), like a home, office, building or group of buildings. LAN transmits data with a speed of several megabits per second. MAN: A Metropolitan Area Network (MAN) is a large computer network that spans a metropolitan area or campus. 2. A MAN typically covers an area up to 10 kms (city). The best example of MAN is the cable Television network, available in many cities.			2 M for geographical area and 2 M for transmission technology. Explanation optional

	<p>WAN: WAN is wide area network. WAN is a long-distance communication network that covers a wide geographic area, such as state or country. The most common example is internet.</p> <p>The transmission technology can be categorized broadly into two types:</p> <ol style="list-style-type: none"> 1. Broadcast networks <p>Broadcast networks have a single communication channel that is shared or used by all the machines on the network. Short messages called packets sent by any machine are received by all the others. Broadcast systems generally use a special code in the address field for addressing a packet to all the concerned computers. This mode of operation is called broadcasting.</p> <ol style="list-style-type: none"> 2. Point-to-point networks <p>Point to point networks consists of many connections between individual pairs of machines. To go from the source to the destination a packet on these types of network may have to go through intermediate computers before they reach the desired computer.</p>	
b	Draw structural diagram of fiber optic cable and write its functions	4 M
Ans	<div style="text-align: center;">  <p>Fig. Structural diagram for Fibre Optic Cable</p> </div> <p>Functions of Optical Cable:</p> <ol style="list-style-type: none"> 1. Single-mode fibers - Used to transmit one signal per fiber (used in telephones and cable TV) 2. 		networks, local area networks)	
	c	Describe various IEEE standards for network topologies.	4 M
	Ans	<p>A set of network standards developed by the IEEE. They include:</p> <ul style="list-style-type: none">• IEEE 802.1: Standards related to network management.• IEEE 802.2: General standard for the data link layer in the OSI Reference Model. The IEEE divides this layer into two sublayers -- the logical link control (LLC) layer and the media access control (MAC) layer. The MAC layer varies for different network types and is defined by standards IEEE 802.3 through IEEE 802.5.• IEEE 802.3: Defines the MAC layer for bus networks that use CSMA/CD. This is the basis of the Ethernet standard.• IEEE 802.4: Defines the MAC layer for bus networks that use a token-passing mechanism (token bus networks).• IEEE 802.5: Defines the MAC layer for token-ring networks.• IEEE 802.6: Standard for Metropolitan Area Networks (MANs).• IEEE 802.11 Wireless Network Standards: 802.11 is the collection of standards setup for wireless networking.	1 Mark for 1 standard each
	d	Draw and explain layered architecture of OSI model.	4M
	Ans	<p>OSI model (Open System Interconnection) model was developed by ISO (international standard organization) which provides way to understand how internetwork operates. It gives guidelines for creating network standard.</p> <p>OSI model has 7 layers as shown in the figure. Application Layer, Presentation Layer, Session Layer, Transport Layer, Network Layer, Data link Layer and Physical Layer</p> <p>Physical (Layer 1) OSI Model, Layer 1 conveys the bit stream - electrical impulse, light or radio signal — through the network at the electrical and mechanical level. It provides the hardware means of sending and receiving data on a carrier, including defining cables, cards and physical aspects.</p> <p>Data Link (Layer 2) At OSI Model, Layer 2, data packets are encoded and decoded into bits. It furnishes transmission protocol knowledge and management and handles errors in the physical layer, flow control and frame synchronization. The data link layer is divided into two sub layers: The Media Access Control (MAC) layer and the Logical Link Control (LLC) layer. The MAC sub layer controls how a computer on the network gains access to the data and permission to transmit it. The LLC layer controls frame synchronization, flow control and error</p>	1 M diagram and 3 M explanation

checking.

OSI Model

Network (Layer 3) Layer 3 provides switching and routing technologies, creating logical paths, known as virtual circuits, for transmitting data from node to node. Routing and forwarding are functions of this layer, as well as addressing, internetworking, error handling, congestion control and packet sequencing.

Transport (Layer 4) Model, Layer 4, provides transparent transfer of data between end systems, or hosts, and is responsible for end-to-end error recovery and flow control. It ensures complete data transfer from source to destination.

Session (Layer 5) This layer establishes, manages and terminates connections between applications. The session layer sets up, coordinates, and terminates conversations, exchanges, and dialogues between the applications at each end. It deals with session and connection coordination.

Presentation (Layer 6) This layer provides independence from differences in data representation (e.g., encryption) by translating from application to network format, and vice versa. The presentation layer works to transform data into the form that the application layer can accept. This layer formats and encrypts data to be sent across a network, providing freedom from compatibility problems. It is sometimes called the syntax & semantics.

Application (Layer 7) OSI Model, Layer 7, supports application and end-user processes. Everything at this layer is application-specific. This layer provides

		application services for file.															
Q3		Attempt any THREE of the following :	12 M														
	a	What advantages does TDM have over FDM in a circuit switched network?	4 M														
	Ans	<p>In TDM, each signal uses all of the bandwidth some of the time, while for FDM, each signal uses a small portion of the bandwidth all of the time.</p> <p>TDM uses the entire frequency range but dynamically allocates time, certain jobs might require less or more time, which TDM can offer but FDM is unable to as it cannot change the width of the allocated frequency.</p> <p>TDM provides much better flexibility compared to FDM.</p> <p>TDM offers efficient utilization of bandwidth</p> <p>Low interference of signal and minimizes cross talk</p>	consider 4 points for 4 M														
	b	Compare Analog and Digital signal	4 M														
	Ans	<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 50%;">Analog signal</th> <th style="width: 50%;">Digital signal</th> </tr> </thead> <tbody> <tr> <td>An analog signal is a continuous wave that changes over a time period.</td> <td>A digital signal is a discrete wave that carries information in binary form.</td> </tr> <tr> <td>An analog signal is represented by a sine wave.</td> <td>A digital signal is represented by square waves.</td> </tr> <tr> <td>Analog signal has no fixed range.</td> <td>Digital signal has a finite numbers i.e. 0 and 1.</td> </tr> <tr> <td>An analog signal is described by the amplitude, period or frequency, and phase.</td> <td>A digital signal is described by bit rate and bit intervals.</td> </tr> <tr> <td>An analog signal is more prone to distortion.</td> <td>A digital signal is less prone to distortion.</td> </tr> <tr> <td>An analog signal transmits data in the form of a wave.</td> <td>A digital signal carries data in the binary form i.e. 0 and 1.</td> </tr> </tbody> </table>	Analog signal	Digital signal	An analog signal is a continuous wave that changes over a time period.	A digital signal is a discrete wave that carries information in binary form.	An analog signal is represented by a sine wave.	A digital signal is represented by square waves.	Analog signal has no fixed range.	Digital signal has a finite numbers i.e. 0 and 1.	An analog signal is described by the amplitude, period or frequency, and phase.	A digital signal is described by bit rate and bit intervals.	An analog signal is more prone to distortion.	A digital signal is less prone to distortion.	An analog signal transmits data in the form of a wave.	A digital signal carries data in the binary form i.e. 0 and 1.	1 M for each difference Consider any 4 valid points
Analog signal	Digital signal																
An analog signal is a continuous wave that changes over a time period.	A digital signal is a discrete wave that carries information in binary form.																
An analog signal is represented by a sine wave.	A digital signal is represented by square waves.																
Analog signal has no fixed range.	Digital signal has a finite numbers i.e. 0 and 1.																
An analog signal is described by the amplitude, period or frequency, and phase.	A digital signal is described by bit rate and bit intervals.																
An analog signal is more prone to distortion.	A digital signal is less prone to distortion.																
An analog signal transmits data in the form of a wave.	A digital signal carries data in the binary form i.e. 0 and 1.																
	c	With suitable diagram describe															
	Ans	<p>(i) STAR Topology (ii) RING Topology</p> <p>Star topology is a network topology where each individual piece of a network is</p>	2M star topology- 1M for														

attached to a central node (often called a hub or switch). The attachment of these network pieces to the central component is visually represented in a form similar to a star.

The hub and hosts, and the transmission lines between them, form a graph with the topology of a star. Data on a star network passes through the hub before continuing to its destination. The hub manages and controls all functions of the network. It also acts as a repeater for the data flow.

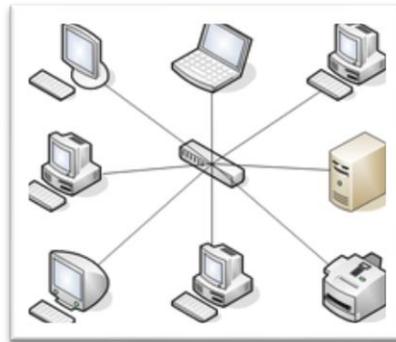

Fig a: Star topology

The star network is one of the most common computer network topologies.

(ii)RING Topology

A ring network is a network topology in which each node connects to exactly two other nodes, forming a single continuous pathway for signals through each node - a ring.

Data travels from node to node, with each node along the way handling every packet.

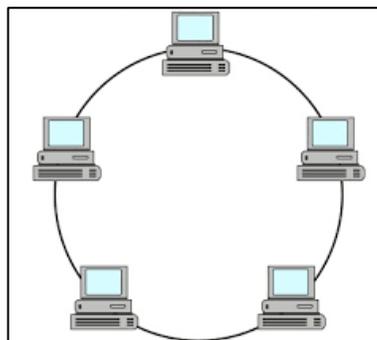

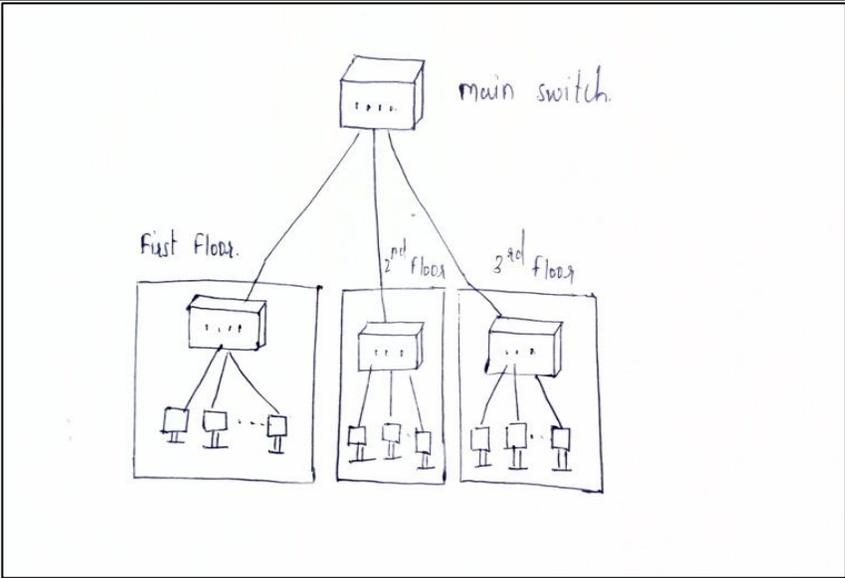

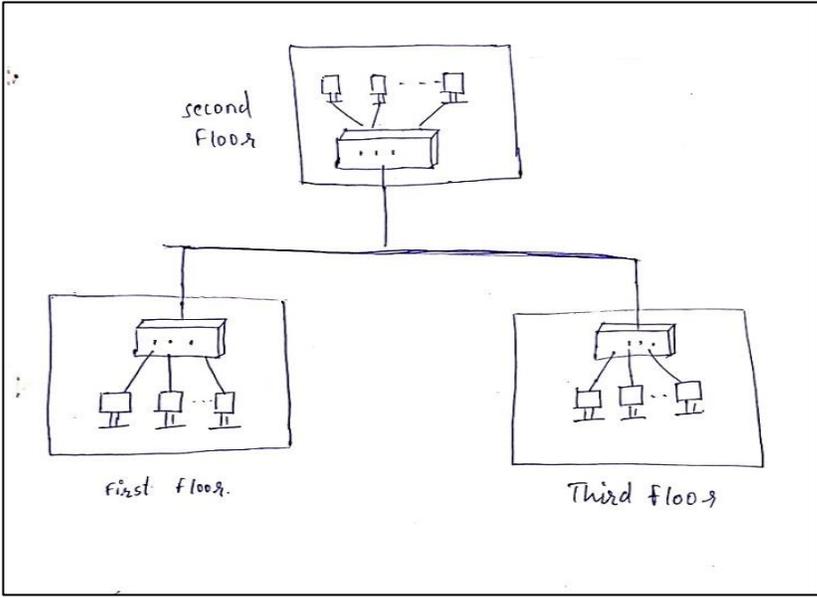

diagram and 1 mark for description, 2M ring topology- 1 M for diagram and 1 Mark for description

		Fig b: Ring Topology Ring topology refers to a specific kind of network setup in which devices are connected in a ring and pass information to or from each other according to their adjacent proximity in the ring structure. This type of topology is highly efficient and handles heavier loads better than bus topology.	
	d	Describe the major functions of network layer in TCP/IP protocol suite	
	Ans	Internetworking: This is the main duty of network layer. It provides the logical connection between different types of networks. Addressing: Addressing is necessary to identify each device on the internet uniquely. This is similar to telephone system. The address used in the network layer should uniquely and universally define the connection of a computer. Routing: In a network, there are multiple roots available from a source to a destination and one of them is to be chosen. The network layer decides the root to be taken. This is called as routing. Packetizing: The network layer encapsulates the packets received from upper layer protocol and makes new packets. This is called as packetizing. It is done by a network layer protocol called IP (Internetworking Protocol).	1 M for each function
	Q4	Attempt any Five of the following:	12 M
	a	Draw and describe architecture for network using tree topology for an office in 3-storeys building.	4 M
	Ans	A tree topology is a special type of structure in which many connected elements are arranged like the branches of a tree Here in the diagram the main switch is connected with three separate switches. For each floor separate switch is connected with multiple terminals.	Explain 1M ,Diagram 3M

		 	
	b	Describe the functions of physical and data link layer of OSI model	4 M
	ans	<p>Functions of Physical Layer</p> <ul style="list-style-type: none"> • Physical layer is the actual carrier of information between computers • Communication between computers happens due to physical layer • Data is actually carried between every adjacent node (computers/routers) by transmission of electromagnetic/optical signals at the physical layer over wired/wireless media 	<p>2M for Physical layer Function and 2 M for Data link layer)(4</p>

		<ul style="list-style-type: none"> Physical layer therefore encompasses the set of all protocols/standards used in different types of Wired/Wireless interfaces and the telecommunication links connecting them It also includes the mechanical, electrical and timing specifications for different network interfaces <p>Functions of Data Link Layer</p> <ul style="list-style-type: none"> Data link layer receives the data from the network layer & divide it into manageable units called frames. It then provides the addressing information by adding header to each frame. Physical addresses of source & destination machines are added to each frame. It provides flow control mechanism to ensure that sender is not sending the data at the speed that the receiver cannot process. It also provide error control mechanism to detect & retransmit damaged, duplicate, or lost frame, thus adding reliability to physical layer. Another function of data link layer is access control. When two or more devices are attached to the same link, data link layer protocols determine which device has control over the link at any given time. 	functions each)												
	c	Differentiate between FDM and TDM	4 M												
	ans	<table border="1"> <thead> <tr> <th>Frequency Division Multiplexing</th> <th>Time division Multiplexing</th> </tr> </thead> <tbody> <tr> <td>FDM divides the channel into two or more frequency ranges that do not overlap</td> <td>TDM divides and allocates certain time periods to each channel in an alternating manner</td> </tr> <tr> <td>Frequency is shared</td> <td>Times scale is shared</td> </tr> <tr> <td>Used with Analog signals</td> <td>Used with both Digital signals and analog signals</td> </tr> <tr> <td>Interference is high</td> <td>Interference is Low or negligible</td> </tr> <tr> <td>Utilization is Ineffective</td> <td>Efficiently used</td> </tr> </tbody> </table>	Frequency Division Multiplexing	Time division Multiplexing	FDM divides the channel into two or more frequency ranges that do not overlap	TDM divides and allocates certain time periods to each channel in an alternating manner	Frequency is shared	Times scale is shared	Used with Analog signals	Used with both Digital signals and analog signals	Interference is high	Interference is Low or negligible	Utilization is Ineffective	Efficiently used	1M for each difference
Frequency Division Multiplexing	Time division Multiplexing														
FDM divides the channel into two or more frequency ranges that do not overlap	TDM divides and allocates certain time periods to each channel in an alternating manner														
Frequency is shared	Times scale is shared														
Used with Analog signals	Used with both Digital signals and analog signals														
Interference is high	Interference is Low or negligible														
Utilization is Ineffective	Efficiently used														
	d	Describe types of IP address classes.	4 M												
	ans	Class A: Class A range for first byte is 0-127. Class A type of IP addresses have First byte	Explain 4 M												

consisting of Network address with first bit as 0 and the next 3 bytes with host id. Hence, number of hosts are more when compared to number of networks. The default subnet masks for class A networks is 255.0.0.0. Class A networks have their network addresses from 1.0.0.0 to 126.0.0.0, with the zero's being replaced by node addresses.

Class B: Class B range for first byte is 128-191. This type has first two bytes specifying network ID with starting two bits as 10 and last two bytes referring to host ID. The default subnet masks for class B is 255.255.0.0. Network addresses for these ranges from 128.0.0.0 to 191.0.0.0.

Class C: Class C range for first byte is 192-223. This class has first three bytes referring to network with starting bits as 110 and last byte signifies Host ID. Here, number of networks is more when compared to number of hosts in each network. The default subnet masks for class C is 255.255.255.0 The network IP addresses for these range from 192.0.0.0 to 223.0.0.0.

Class D: Class D range for first byte is 224-239 Class D is used for multicasting and its starting bits are 1110

Class E: Class E range for first byte is 240-255 .Class E is reserved for future use and its starting bits are 1111

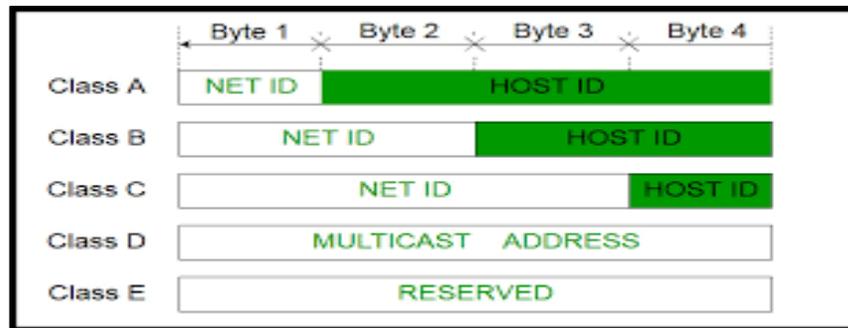

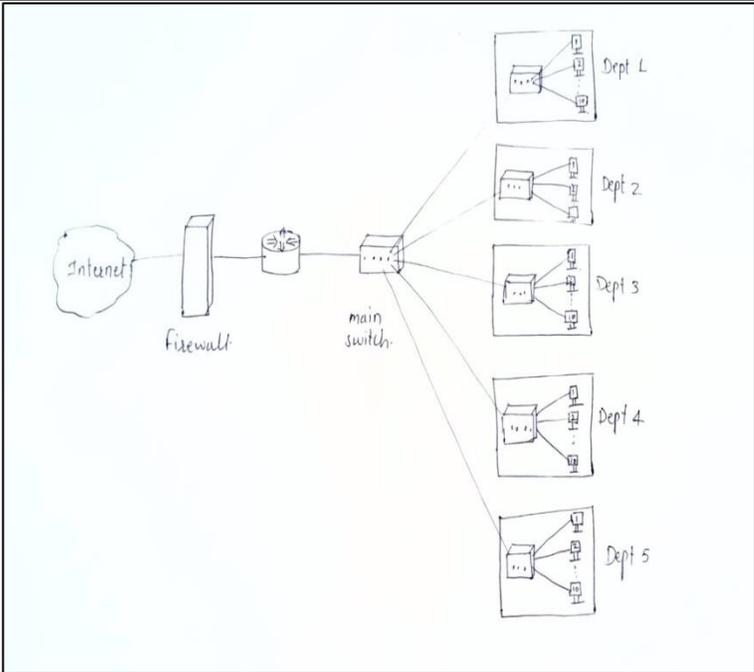

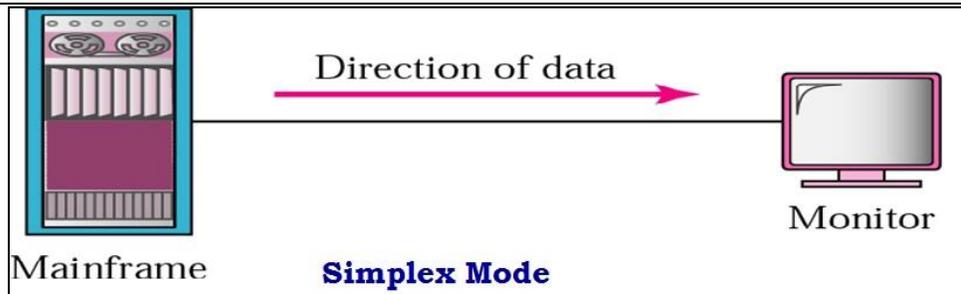

Fig : IP address classes

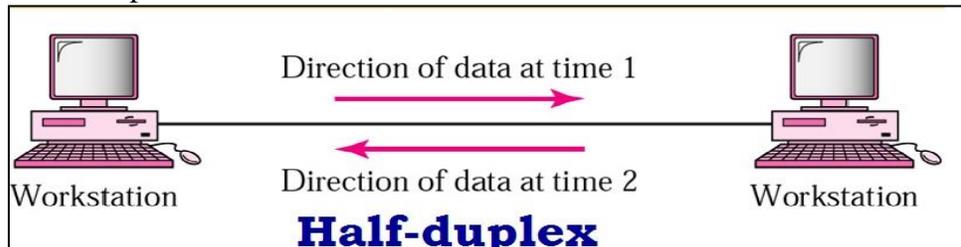

e	Design suitable network layout for an organization with five department	4 M
---	---	-----

	ans		ten users each (Correct dia 4M) Consider any suitable diagram
Q5	Attempt any TWO of the following:		12 M
a	Describe the process of data communication in various modes		6 M
ans	<p>Transmission mode refers to the mechanism of transferring of data between two devices connected over a network. It is also called Communication Mode. These modes direct the direction of flow of information. There are three types of transmission modes.</p> <p>They are:</p> <ul style="list-style-type: none"> • Simplex Mode • Half duplex Mode • Full duplex Mode <p>a. In Simplex mode, the communication is unidirectional, as on a one-way street. Only one of the two devices on a link can transmit; the other can only receive. The simplex mode can use the entire capacity of the channel to send data in one direction.</p> <p>-Keyboards, traditional monitors and printers are examples of simplex devices.</p>		mode explanati on 1 M each & diagram 1 M each

- a. In half-duplex mode, each station can both transmit and receive, but not at the same time. When one device is sending, the other can only receive, and vice versa. The half-duplex mode is used in cases where there is no need for communication in both directions at the same time. The entire capacity of the channel can be utilized for each direction
 -for example :Walkie-talkies.

- b. In full-duplex mode both stations can transmit and receive data simultaneously. The transmission medium sharing can occur in two ways, namely, either the link must contain two physically separate transmission paths or the capacity of the channel is divided between signals traveling in both directions.
 -One common example of full-duplex communication is the telephone network. When two people are communicating by a telephone line, both can talk and listen at the same time.

b	Why is circuit switching preferred over packet switching in voice communication?	6 M
ans	Switching is a mechanism by which data/information sent from source towards destination which are not directly connected. Networks have interconnecting devices, which receives data from directly connected sources, stores data, analyse it and then forwards to the next interconnecting device closest to the destination. Switching can be categorized as: <ul style="list-style-type: none"> • Circuit switching • Packet switching 	Any six points 1 M each

MAHARASHTRA STATE BOARD OF TECHNICAL EDUCATION
(Autonomous)
(ISO/IEC - 27001 - 2013 Certified)

		<ul style="list-style-type: none">• Message switching <p>Circuit switching is preferred over packet switching in voice communication because:</p> <ul style="list-style-type: none">• In circuit switching, a dedicated path is established between sender and receiver which is maintained for entire duration of conversation.• It provides continuous and guaranteed delivery of data.• During the data transfer phase, no addressing is needed.• Delays are small.• It uses connection oriented service.• Message received in order to the destination	
	c	Your company has the network id 165.130.0.0. You are responsible for creating subnets on the network, and each subnet must provide at least 1000 host ids. What subnet mask meets the requirement for the minimum number of host ids and provides the highest number of subnets?	6 M
	ans	<p>The given network id 165.130.0.0 is class B (Range of class B is 128.0.0.0 to 191.255.255.255) with subnet mask of 255.255.252.0 creates 62 subnets with 1022 host each.</p> <p>In binary format subnet mask reads:</p> <p>11111111.11111111.11111100.00000000.</p> <p>To calculate the number of host ids available for each subnet is based on the number of digits remaining in the network address.</p> <p>The number of possible host ids in each subnet ranges from 00000001 through 11111110.</p> <p>So, in the network 165.130.0.0/22, host addresses can range from 165.130.0.1 through 165.130.254</p>	Explanati on 6 M
	Q6	Attempt any TWO of the following:	
	a	A system uses CRC on a block of 8 bytes. How many redundant bits are sent per block? What is the ratio of useful bits to total bits?	6 M
	ans	<p>CRC is one of the most common and powerful error detecting code which can be describe as follows. The polynomial code also known as CRC with co-efficient of 0s and 1s. In this method the sender and receiver must agree upon generator polynomial $g(x)$ in advance. Both the high and low order bits of the generator (divisor) must be 1. To compute the checksum for some frame (data) with m bits, the frame must be longer than generator polynomial. The idea is to append checksum to the end of frame in such a way that the polynomial represented by the checksum frame is divisible by $g(x)$. When the receiver gets the checksum frame it</p>	Descripti on 6 M *The student may assume a polynomi al or a

	<p>tries dividing it by $g(x)$. If there is remainder there has been a transmission error and zero remainder means no error in the transmission. r is degree of $g(x)$ polynomial.</p> <p>Step by step procedure:</p> <ol style="list-style-type: none"> 1. Append a string of r zero bits to the lower order end of data word(m) where r is less than the number of bits pre-decided divisor by 1 bit i.e. if divisor = 5 bits then $r = 4$ zeros. Now data word contains $m+r$ bits 2. Divide the newly generated data unit in step 1 by the divisor. It is module – 2 division 3. The remainder obtained after division is the r bit CRC. 4. This CRC will replace the r zeros appended to the data unit to get the code word to be transmitted. <p>NOTE: The polynomial code for calculation of redundant bits is not given .hence the data given is insufficient for calculating redundant bits and the ratio of useful bits to total bits.</p>	<p>divisor and do the problem. Full marks has to be given even if they explain the method or do the problem with assumptions'.</p>
<p>b</p>	<p>Describe the process of DHCP server configuration.</p>	<p>6 M</p>
<p>ans</p>	<p>DHCP (Dynamic Host Configuration Protocol) is a client-server protocol that uses DHCP servers and DHCP clients. A DHCP server is a machine that runs a service that can lease out IP addresses and other TCP/IP information to any client that requests them. The DHCP server typically has a pool of IP addresses that it is allowed to distribute to clients, and these clients lease an IP address from the pool for a specific period of time, usually several days. Once the lease is ready to expire, the client contacts the server to arrange for renewal. DHCP clients are client machines that run special DHCP client software enabling them to communicate with DHCP server.</p> <div data-bbox="350 1356 1149 1570" data-label="Diagram"> <pre> sequenceDiagram participant Client as DHCP client participant Server as DHCP server Client->>Server: 1 DHCPDISCOVER Server-->>Client: 2 DHCPOFFER Client->>Server: 3 DHCPREQUEST Server-->>Client: 4 DHCPACK </pre> </div> <p>DHCP clients obtain a DHCP lease for an IP address, a subnet mask, and various DHCP options from DHCP servers in a four-step process:</p> <p>DHCP DISCOVER: The client broadcasts a request for a DHCP server.</p> <p>DHCPOFFER: DHCP servers on the network offer an address to the client.</p> <p>DHCPREQUEST: The client broadcasts a request to lease an address from one of</p>	<p>Diagram 2M, Explanati on 4 M</p>

		the offering DHCP servers. DHCPACK: The DHCP server that the client responds to acknowledges the client, assigns it any configured DHCP options, and updates its DHCP database. The client then initializes and binds its TCP/IP protocol stack and can begin network communication.	
	c	What is the MAC protocol used in TOKEN ring LAN's? What happens if the token is lost?	6 M
	ans	<p>Token ring local area network (LAN) network is a communication protocol for local area networks.it uses special three-byte frame called a “token” that travels around a logical ring of workstations or servers. This token passing is a channel access method providing fair access for all stations, and eliminating the collision of contention-based access methods.</p> <p>Introduced by IBM in 1984, it was then standardized with protocol IEEE 802.5 and was fairly successful, particularly in the corporate environments, but gradually eclipsed by the later versions of Ethernet.</p> <p>The IEEE 802.5 Token ring technology provides for data transfer rates of either 4 or 16 Mbps.</p> <p>It works in the following manner:</p> <ol style="list-style-type: none">1. Empty information frames are continuously circulated on the ring.2. When a computer has a message to send, it inserts a token in an empty frame (simply changing a 0 to a 1 in the token bit part of the frame) and a message and a destination identifier in the frame.3. The frame is the examined by each successive workstation. If workstation sees that it is the destination of the message, it copies the message from the frame and changes the token back to 0.4. When the frame gets back to originator, it sees that message has been copied and received. <p>The Fibre Distributed Data Interface (FDDI) also uses a Token ring protocol.</p> <p>If one device does not receive a token within a specified period, it can issue an alarm. The alarm alerts the network administrator to the problem and its location. Then, network administrator generates a new , free token</p> <p>OR</p>	Descripti on of MAC protocol 4 M, Explanati on of token lost 2 M

3 Hours / 70 Marks

Seat No.

--	--	--	--	--	--	--	--

- Instructions* – (1) All Questions are *Compulsory*.
(2) Illustrate your answers with neat sketches wherever necessary.
(3) Figures to the right indicate full marks.
(4) Assume suitable data, if necessary.
(5) Mobile Phone, Pager and any other Electronic Communication devices are not permissible in Examination Hall.

Marks

- 1. Attempt any FIVE of the following: 10**
- a) Define bit rate and baud rate.
 - b) List different characteristics of data communication system.
(Any two)
 - c) Define guided and unguided communication media.
 - d) Classify mobile generations.
 - e) Compare LRC and CRC (Any two points each.)
 - f) State different types of Network topologies.
 - g) List classes of IP addressing with their IP address range.
- 2. Attempt any THREE of the following: 12**
- a) Differentiate between synchronous and asynchronous communication. (Any four points.)
 - b) Draw and explain fiber optic cable.
 - c) Explain wireless LAN 802.11 architecture.
 - d) State the functions of any two layers of OSI model.

P.T.O.

- 3. Attempt any THREE of the following:** **12**
- a) State the two advantages and two disadvantages of unguided media.
 - b) Draw and explain block diagram of communication system.
 - c) Describe different connecting devices used in computer network.
 - d) Draw and explain OSI reference model.
- 4. Attempt any THREE of the following:** **12**
- a) Describe multiplexing techniques.
 - b) Compare IPV₄ and IPV₆. (Any four points.)
 - c) Explain circuit switching network with neat sketch.
 - d) Draw and explain TCP/IP model.
 - e) Explain various IEEE communication standards.
- 5. Attempt any TWO of the following:** **12**
- a) Explain simplex, half duplex and full duplex modes in data communication.
 - b) Describe the principles of packet switching and circuit switching techniques with neat diagram.
 - c) Explain configuration of TCP/IP protocol in network.
- 6. Attempt any TWO of the following:** **12**
- a) Describe bluetooth architecture technologies.
 - b) Explain the process of DHCP server configuration.
 - c) Describe wireless infrastructure components in detail.
-

WINTER – 19 EXAMINATION
Subject Name: Data Communication and Network

Model Answer

Subject Code: 22414

Important Instructions to examiners:

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills).
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.

Q. No.	Sub Q. N.	Answer	Marking Scheme
1.		Attempt any Five of the following:	10M
	a	Define bit rate and baud rate.	2M
	Ans	Bit Rate: Bit rate is simply the number of bits (i.e., 0's and 1's) transmitted per unit time. Baud Rate: Baud rate is the number of signal units transmitted per unit time that is needed to represent those bits.	1M-Bit rate 1M-Baud Rate
	b	List different characteristics of data communication system.(Any two)	2M
	Ans	1. Delivery 2. Accuracy 3. Timeliness 4. Jitter	1 M for 1 characteristic
	c	Define guided and unguided communication media.	2M
	Ans	Guided communication media: Guided transmission media are known as the wired communication . The electromagnetic signals travel between the communicating devices through a physical medium/conductor. Unguided communication media: The unguided media is also called wireless communication . It does not require any physical medium to transmit electromagnetic signals. In unguided media, the electromagnetic signals are broadcasted through air to everyone.	1M-Guided media 1M-Unguided media

In asynchronous transmission, time interval of transmission is not constant, it is random.	1M for 1 point
Synchronous communication	Asynchronous communication																
In Synchronous Transmission, data is sent in form of blocks or frames.	In Asynchronous Transmission, data is sent in form of byte or character.																
Sender and Receiver use the same clock signal	Does not need clock signal between the sender and the receiver																
It is more efficient and more reliable than asynchronous transmission to transfer the large amount of data.	In this transmission start bits and stop bits are added with data.																
<p style="text-align: center;">Synchronous Transmission</p>	<p style="text-align: center;">Asynchronous Transmission</p>																
Synchronous transmission is fast.	Asynchronous transmission is slow.																
In Synchronous transmission, time interval of transmission is constant.	In asynchronous transmission, time interval of transmission is not constant, it is random.																
	b	Draw and explain fiber optic cable.	4M														
	Ans	<div style="text-align: center;"> </div> <p>Fiber optic cable:</p> <ul style="list-style-type: none"> • A fiber-optic cable is made up of glass or plastic. • It transmits signals in the form of light. • The outer jacket is made up of PVC or Teflon. • Kevlar strands are placed inside the jacket to strengthen the cable. • Below the Kevlar strands, there is another plastic coating which acts as a cushion. • The fiber is at the center of the cable, and it consists of cladding and glass core. • The density of the cladding is less than that of the core. 	2 M Labelled Diagram, 2 M explanation														

		<ul style="list-style-type: none"> Optical fibers use the principle of 'reflection' to pass light through a channel. 	
	c	Explain wireless LAN 802.17 architecture.	4M
	Ans	<p>Wireless LAN 802.11: The IEEE 802.11 standard defines the physical layer and media access control (MAC) layer for a wireless local area network. Wireless LANs transmit and receive data over the atmosphere, using radio frequency (RF) or infrared optical technology, thereby; eliminating the need for fixed wired connections.</p> <p>802.11 Architecture:</p> <p>The 802.11 architecture defines two types of services:</p> <ol style="list-style-type: none"> Basic services set (BSS) Extended Service Set (ESS) <p>1. Basic Services Set (BSS)</p> <ul style="list-style-type: none"> The basic services set contain stationary or mobile wireless stations and a central base station called access point (AP). The use of access point is optional. If the access point is not present, it is known as stand-alone network. Such a BSS cannot send data to other BSSs. This type of architecture is known as adhoc architecture. The BSS in which an access point is present is known as an infrastructure network. <div style="text-align: center;"> <p style="text-align: center;">Basic Service Sets</p> </div> <p>2. Extend Service Set (ESS) An extended service set is created by joining two or more basic service sets (BSS) having access points (APs).</p>	<p>Consider IEEE 802.11 instead of 802.17</p> <p>BSS diagram 1M, Explanation - 1M- ESS diagram 1M, Explanation - 1M</p> <p>*Note: If student attempted to solve the answer give appropriate marks.</p>

These extended networks are created by joining the access points of basic services sets through a wired LAN known as distribution system.

There are two types of stations in ESS:

- (i) **Mobile stations:** These are normal stations inside a BSS.
- (ii) **Stationary stations:** These are AP stations that are part of a wired LAN.

d	State the functions of any two layers of OSI Model	4M
Ans	<p>The functions of the physical layer are :</p> <ol style="list-style-type: none"> 1. Bit synchronization: The physical layer provides the synchronization of the bits by providing a clock. This clock controls both sender and receiver thus providing synchronization at bit level. 2. Bit rate control: The Physical layer also defines the transmission rate i.e. the number of bits sent per second. 3. Physical topologies: Physical layer specifies the way in which the different, devices/nodes are arranged in a network i.e. bus, star or mesh topology. 4. Transmission mode: Physical layer also defines the way in which the data flows between the two connected devices. The various transmission modes possible are: Simplex, half-duplex and full-duplex. 	Functions of each layer-2M

Functions of data link layer:

- **Framing:** Data-link layer takes packets from Network Layer and encapsulates them into Frames. Then, it sends each frame bit-by-bit on the hardware. At receiver' end, data link layer picks up signals from hardware and assembles them into frames.
- **Addressing:** Data-link layer provides layer-2 hardware addressing mechanism. Hardware address is assumed to be unique on the link. It is encoded into hardware at the time of manufacturing.
- **Synchronization:** When data frames are sent on the link, both machines must be synchronized in order to transfer to take place.
- **Error Control:** Sometimes signals may have encountered problem in transition and the bits are flipped. These errors are detected and attempted to recover actual data bits. It also provides error reporting mechanism to the sender.
- **Flow Control:** Stations on same link may have different speed or capacity. Data-link layer ensures flow control that enables both machines to exchange data on same speed.
- **Multi-Access:** When host on the shared link tries to transfer the data, it has a high probability of collision. Data-link layer provides mechanism such as CSMA/CD to equip capability of accessing a shared media among multiple Systems.

Functions of the Network layer are as follows:

- It is responsible for routing packets from the source host to the destination host. The routes can be based upon static tables that are rarely changed, or they can be automatically updated depending upon network conditions.
- The data link layer assigns the physical address locally. When the data packets are routed to remote locations, a logical addressing scheme is required to differentiate between the source system and the destination system. This is provided by the network layer.
- This layer also provides mechanisms for congestion control.
- The network layer tackles issues like transmission delays, transmission time, avoidance of jitters, etc.

Functions of Transport Layer

- **Service Point Addressing:** Transport Layer header includes service point address which is port address. This layer gets the message to the correct process on the computer unlike Network Layer, which gets each packet to the correct computer.
- **Segmentation and Reassembling:** A message is divided into segments; each segment contains sequence number, which enables this layer in reassembling the message. Message is reassembled correctly upon

		<p>arrival at the destination and replaces packets which were lost in transmission.</p> <ul style="list-style-type: none"> • Connection Control: It includes 2 types: • Connectionless Transport Layer: Each segment is considered as an independent packet and delivered to the transport layer at the destination machine. • Connection Oriented Transport Layer: Before delivering packets, connection is made with transport layer at the destination machine. • Flow Control: In this layer, flow control is performed end to end. • Error Control: Error Control is performed end to end in this layer to ensure that the complete message arrives at the receiving transport layer without any error. Error Correction is done through retransmission. <p>The functions of the Session layer are :</p> <ol style="list-style-type: none"> 1. Session establishment, maintenance and termination: The layer allows the two processes to establish, use and terminate a connection. 2. Synchronization: This layer allows a process to add checkpoints which are considered as synchronization points into the data. These synchronization point help to identify the error so that the data is re-synchronized properly, and ends of the messages are not cut prematurely and data loss is avoided. 3. Dialog Controller: The session layer allows two systems to start communication with each other in half-duplex or full-duplex. <p>The functions of the presentation layer are :</p> <ol style="list-style-type: none"> 1. Translation: For example, ASCII to EBCDIC. 2. Encryption/ Decryption: Data encryption translates the data into another form or code. The encrypted data is known as the cipher text and the decrypted data is known as plain text. A key value is used for encrypting as well as decrypting data. 3. Compression: Reduces the number of bits that need to be transmitted on the network. <p>The functions of the Application layer are :</p> <ol style="list-style-type: none"> 1. Network Virtual Terminal 2. FTAM-File transfer access and management 3. Mail Services 4. Directory Services 	
3.		Attempt any Three of the following:	12M
	a	State the two advantages and disadvantages of unguided media	4M
	Ans	Advantages: 1 .Use for long distance communication.	2 M advantages

	<p>Receiver: It is the device which receives the message and reproduces it. A receiver can be host, camera, workstation, telephone etc.</p> <p>Protocol: A protocol is defined as set of rules agreed by sender and receiver. Protocol governs the exchange of data in true sense.</p>	
c	Describe different connecting devices used in computer network.	4M
Ans	<p>Network Connecting devices are:</p> <ol style="list-style-type: none">1. Repeater2. Hub3. Switch4. Bridge5. Router6. Gateway7. Modem <p>Repeater:</p> <ul style="list-style-type: none">•It is used to take the distorted, weak and corrupt input signal and regenerate this signal at its output.•It ensures that the signals are not distorted or weak before it reaches the destination.•It recreates the bit pattern of the signal, and puts this regenerated signal back on to the transmission medium•It works in the physical layer with no intelligent function. <p>Hub:</p> <ul style="list-style-type: none">•It is also known as multiport repeater.•It is normally used for connecting stations in a physical star topology.•It is the broadcasting device.•It sends packets to all nodes in the network. <p>Switch: It is used to connect multiple computers in which it can direct a transmission to its specific destination. (Unicast the signals).</p>	<p>Any 4 devices. 1 M each</p>

	<ul style="list-style-type: none">●It is a unicasting device.●It avoids unnecessary network traffic.●It operates in both the physical and the data link layer. <p>Bridge:</p> <ul style="list-style-type: none">●It is a device which connects two or more segment of a network.●A bridge filters data traffic at a network boundary.●Bridges reduces the amount of traffic on a LAN by dividing it into two segments.●It inspects incoming traffic and decides whether to forward or discard it.●It sends packets between two networks of same type.●A bridge operates in both the physical and the data link layer. <p>Gateway:</p> <ul style="list-style-type: none">●It is a node in a computer network, a key stopping point for data on its way to or from other networks.●Gateway is protocol converter.●Gateway enables communication between different network architecture and environments.●It works at all layers of OSI model. <p>Router:</p> <ul style="list-style-type: none">●It is a device that helps in determining the best and shortest path out of the available paths, for a particular transmission.●Routers use logical and physical addressing to connect two or more logically separate networks.●Router read complex network address in packet and efficiently directs packets from one network to another, reducing excessive traffic.●It works at Physical, Data-Link and Network Layer of OSI model●It Connect dissimilar networks. <p>Modem:</p>	
--	--	--

		<ul style="list-style-type: none">•Modem works as modulator as well as demodulator.•It is the device used to converts digital signals generated by the computer into analog signals which can be transmitted over a telephone or cable line transforms incoming analog signals into their digital equivalents.•A two way communication is established.	
	d	Draw and explain OSI reference model.	4M
	Ans	<p>OSI model (Open System Interconnection) model was developed by ISO (international standard organization) which provides way to understand how internetwork operates. It gives guidelines for creating network standard.</p> <p>OSI model has 7 layers as shown in the figure.</p> <p>Application Layer, Presentation Layer ,Session Layer, Transport Layer ,Network Layer ,Data link Layer and Physical Layer</p> <p>Physical (Layer 1) OSI Model, Layer 1 conveys the bit stream - electrical impulse, light or radio signal — through the network at the electrical and mechanical level. It provides the hardware means of sending and receiving data on a carrier, including defining cables, cards and physical aspects.</p> <p>Data Link (Layer 2) At OSI Model, Layer 2, data packets are encoded and decoded into bits. It furnishes transmission protocol knowledge and management and handles errors in the physical layer, flow control and frame synchronization. The data link layer is divided into two sub layers: The Media Access Control (MAC) layer and the Logical Link Control (LLC) layer. The MAC sub layer controls how a computer on the network gains access to the data and permission to transmit it. The LLC layer controls frame synchronization, flow control and error checking.</p> <p>Network (Layer 3) Layer 3 provides switching and routing technologies, creating logical paths, known as virtual circuits, for transmitting data from node to node. Routing and forwarding are functions of this layer, as well as addressing, internetworking, error handling, congestion control and packet sequencing.</p> <p>Transport (Layer 4) Layer 4, provides transparent transfer of data between end systems, or hosts, and is responsible for end-to-end error recovery and flow control. It ensures complete data transfer from source to destination.</p> <p>Session (Layer 5) This layer establishes, manages and terminates connections between applications. The session layer sets up, coordinates, and terminates conversations, exchanges, and dialogues between the applications at each end. It deals with session and connection coordination</p>	1 M diagram and 3 M explanation

		<p>Presentation (Layer 6) This layer provides independence from differences in data representation (e.g., encryption) by translating from application to network format, and vice versa. The presentation layer works to transform data into the form that the application layer can accept. This layer formats and encrypts data to be sent across a network, providing freedom from compatibility problems. It is sometimes called the syntax & semantics.</p> <p>Application (Layer 7) OSI Model, Layer 7, supports application and end-user processes. Everything at this layer is application-specific. This layer provides application services for file.</p> <div style="text-align: center; border: 1px solid black; padding: 5px; margin: 10px auto; width: fit-content;"> <table style="border-collapse: collapse; margin: 0 auto;"> <tr><td style="border: 1px solid black; padding: 2px 10px;">Application Layer</td></tr> <tr><td style="border: 1px solid black; padding: 2px 10px;">Presentation Layer</td></tr> <tr><td style="border: 1px solid black; padding: 2px 10px;">Session Layer</td></tr> <tr><td style="border: 1px solid black; padding: 2px 10px;">Transport Layer</td></tr> <tr><td style="border: 1px solid black; padding: 2px 10px;">Network Layer</td></tr> <tr><td style="border: 1px solid black; padding: 2px 10px;">Data link Layer</td></tr> <tr><td style="border: 1px solid black; padding: 2px 10px;">Physical Layer</td></tr> </table> <p>OSI Model</p> </div>	Application Layer	Presentation Layer	Session Layer	Transport Layer	Network Layer	Data link Layer	Physical Layer

4.		Attempt any Three of the following:	12M							
	a	Describe Multiplexing techniques	4M							
	Ans	<p>Multiplexing is a technique by which different analog and digital streams of transmission can be simultaneously processed over a shared link. Multiplexing divides the high capacity medium into low capacity logical medium which is then shared by different streams. Communication is possible over the air (radio frequency), using a physical media (cable), and light (optical fiber). All mediums are capable of multiplexing. When multiple senders try to send over a single medium, a device called Multiplexer divides the physical channel and allocates one to each. On the other end of communication, a De-multiplexer receives data from a single medium, identifies each, and sends to different receivers.</p> <p>Different multiplexing techniques are</p> <ol style="list-style-type: none"> 1. Frequency Division multiplexing 2. Time division multiplexing <p>Frequency Division Multiplexing: When the carrier is frequency, FDM is used. FDM is an analog technology. FDM divides the spectrum or carrier</p>	2 M each technique explanation							

bandwidth in logical channels and allocates one user to each channel. Each user can use the channel frequency independently and has exclusive access of it. All channels are divided in such a way that they do not overlap with each other. Channels are separated by guard bands. Guard band is a frequency which is not used by either channel.

Time Division Multiplexing: TDM is applied primarily on digital signals but can be applied on analog signals as well. In TDM the shared channel is divided among its user by means of time slot. Each user can transmit data within the provided time slot only. Digital signals are divided in frames, equivalent to time slot i.e. frame of an optimal size which can be transmitted in given time slot.

TDM works in synchronized mode. Both ends, i.e. Multiplexer and De-multiplexer are timely synchronized and both switch to next channel simultaneously.

When channel A transmits its frame at one end, the De-multiplexer provides media to channel A on the other end. As soon as the channel A's time slot expires, this side switches to channel B. On the other end, the De-multiplexer

		works in a synchronized manner and provides media to channel B. Signals from different channels travel the path in interleaved manner																			
	b	Compare IPV4 and IPV6 (any four point)	4M																		
	Ans	<table border="1" style="width: 100%; border-collapse: collapse; margin-left: 20px;"> <thead> <tr> <th style="width: 50%; text-align: center;">IPV4</th> <th style="width: 50%; text-align: center;">IPv6</th> </tr> </thead> <tbody> <tr> <td>Source and destination addresses are 32 bits (4 bytes) in length.</td> <td>Source and destination addresses are 128Bits (16 bytes) in length.</td> </tr> <tr> <td>No. addresses are limited to number of bits (32 bits)</td> <td>Larger addressing area</td> </tr> <tr> <td>Uses broadcast addresses to send traffic to all nodes on a subnet.</td> <td>There are no IPv6 broadcast addresses. IPV4	IPv6																				
Source and destination addresses are 32 bits (4 bytes) in length.	Source and destination addresses are 128Bits (16 bytes) in length.																				
No. addresses are limited to number of bits (32 bits)	Larger addressing area																				
Uses broadcast addresses to send traffic to all nodes on a subnet.	There are no IPv6 broadcast addresses. Instead, multicast scoped addresses aroused																				
Fragmentation is supported at Originating hosts and intermediate routers.	Fragmentation is not supported at routers. It is only supported at the originating host																				
IP header includes a checksum	IP header does not include a checksum.																				
IP header includes options	All optional data is moved to IPv6extension headers																				
IPv4 has classful addressing scheme, includes classes like A,B,C,D and E.	Classless addressing scheme.																				
Uses decimal dotted notation	Uses hexadecimal notation																				
	c	Explain circuit switching networks with neat sketch.	4M																		
	Ans	<p>Circuit switching is a connection-oriented network switching technique. Here, a dedicated route is established between the source and the destination and the entire message is transferred through it.</p> <p>Phases of Circuit Switch Connection:</p> <ul style="list-style-type: none"> • Circuit Establishment: In this phase, a dedicated circuit is established from the source to the destination through a number of intermediate switching centers. The sender and receiver transmits communication signals to request and acknowledge establishment of circuits. 	1 M for diagram. 3 M for explanation																		

	<ul style="list-style-type: none">• Data Transfer: Once the circuit has been established, data and voice are transferred from the source to the destination. The dedicated connection remains as long as the end parties communicate.• Circuit Disconnection: When data transfer is complete, the connection is relinquished. The disconnection is initiated by any one of the user. Disconnection involves removal of all intermediate links from the sender to the receiver. <div data-bbox="495 541 1274 894" data-label="Diagram"><p>The diagram illustrates a circuit-switched network. It shows two telephones at the ends of a path. The path consists of several switching offices, represented by blue boxes with four ports each. Black lines connect these switching offices, representing permanent links between them. A specific path is highlighted with a dashed line, indicating the circuit established for communication between the two telephones. Labels in the diagram include 'Links established in the switching offices' pointing to the dashed path, 'Switching Office' pointing to one of the blue boxes, and 'Permanent links between offices' pointing to the black lines connecting the boxes.</p></div> <p>The diagram represents circuit established between two telephones connected by circuit switched connection. The blue boxes represent the switching offices and their connection with other switching offices. The black lines connecting the switching offices represent the permanent link between the offices.</p>	
d	Draw and explain TCP/IP model.	4M
Ans	<p>TCP/IP that is Transmission Control Protocol and Internet Protocol has following features</p> <ul style="list-style-type: none">• Support for a flexible architecture. Adding more machines to a network was easy.• The network is robust, and connections remained intact until the source and destination machines were functioning. The main idea was to allow one application on one computer to talk to (send data packets) another application running on different computer. <p>Different Layers of TCP/IP Reference Model Below:</p>	1 M for diagram. 3 M for explanation

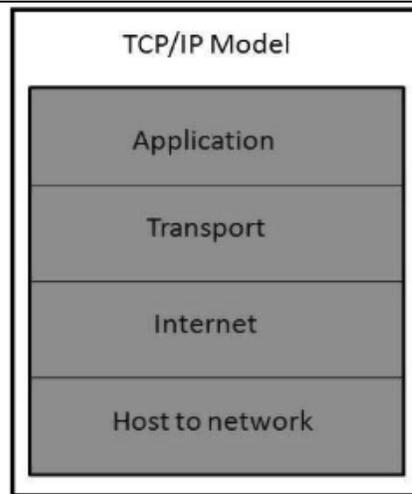

Fig: TCP/IP reference model

Layer 1: Host-to-network Layer

1. Lowest layer of the all.
2. Protocol is used to connect to the host, so that the packets can be sent over it.
3. Varies from host to host and network to network.

Layer 2: Internet layer

1. Selection of a packet switching network which is based on a connectionless internetwork layer is called a internet layer.
2. It is the layer which holds the whole architecture together.
3. It helps the packet to travel independently to the destination.
4. Order in which packets are received is different from the way they are sent.
5. IP (Internet Protocol) is used in this layer.

6. The various functions performed by the Internet Layer are:

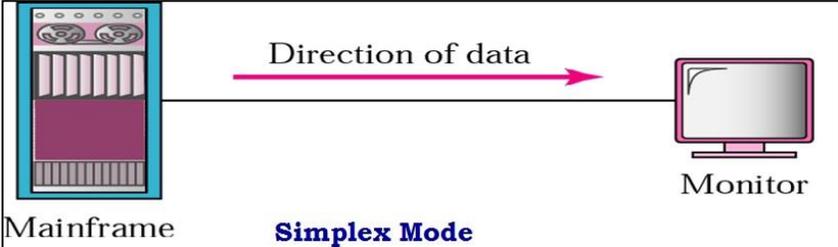

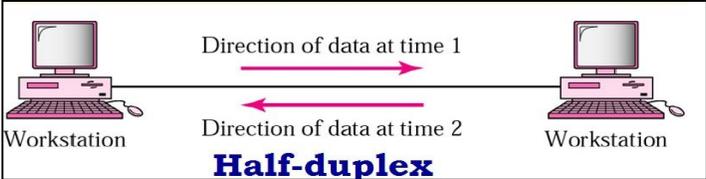

- Delivering IP packets
- Performing routing
- Avoiding congestion

Layer 3: Transport Layer

	<p>1. It decides if data transmission should be on parallel path or single path.</p> <p>2. Functions such as multiplexing, segmenting or splitting on the data is done by transport layer.</p> <p>3. The applications can read and write to the transport layer.</p> <p>4. Transport layer adds header information to the data.</p> <p>5. Transport layer breaks the message (data) into small units so that they are handled more efficiently by the network layer.</p> <p>6. Transport layer also arrange the packets to be sent, in sequence</p> <p>Layer 4: Application Layer</p> <p>The TCP/IP specifications described a lot of applications that were at the top of the protocol stack. Some of them were TELNET, FTP, SMTP, DNS etc.</p> <p>1. Telnets a two-way communication protocol which allows connecting to a remote machine and run applications on it.</p> <p>2. FTP (File Transfer Protocol) is protocol that allows File transfer amongst computer users connected over a network. It is reliable, simple and efficient.</p> <p>3. SMTP (Simple Mail Transport Protocol) is a protocol, which is used to transport electronic mail between a source and destination, directed via a route.</p> <p>4. DNS (Domain Name Server) resolves an IP address into a textual address for Hosts connected over a network.</p> <p>5. It allows peer entities to carry conversation.6.It defines two end-to-end protocols: TCP and UDP.</p>	
e	Explain various IEEE communication standards.	4M
Ans	<p>A set of network standards developed by the IEEE. They include:</p> <ul style="list-style-type: none"> • IEEE 802.1: Standards related to network management. • IEEE 802.2: General standard for the data link layer in the OSI Reference Model. The IEEE divides this layer into two sublayers -- the logical link control (LLC) layer and the media access control (MAC) layer. The MAC layer varies for different network types and is defined by standards IEEE 802.3 through IEEE 802.5. • IEEE 802.3: Defines the MAC layer for bus networks that use CSMA/CD. This is the basis of the Ethernet standard. <p>IEEE 802.4: Defines the MAC layer for bus networks that use a token passing mechanism (token bus networks).</p>	1 M for 1 standard each

		<ul style="list-style-type: none"> IEEE 802.5: Defines the MAC layer for token-ring networks. IEEE 802.6: Standard for Metropolitan Area Networks (MANs). IEEE 802.11 Wireless Network Standards: 802.11 is the collection of standards setup for wireless networking. 	
5.		Attempt any Two of the following:	12M
	a	Explain simplex, half duplex and full duplex modes in data communication.	6M
Ans	<p>Transmission mode refers to the mechanism of transferring of data between two devices connected over a network. It is also called Communication Mode. These modes direct the direction of flow of information. There are three types of transmission modes.</p> <p>They are:</p> <ul style="list-style-type: none"> Simplex Mode Half duplex Mode Full duplex Mode <p>1. In Simplex mode, the communication is unidirectional, as on a one-way street. Only one of the two devices on a link can transmit; the other can only receive. The simplex mode can use the entire capacity of the channel to send data in one direction.</p> <p>Keyboards, traditional monitors and printers are examples of simplex devices.</p> <div style="text-align: center;">  <p>Simplex Mode</p> </div> <p>2. In half-duplex mode, each station can both transmit and receive, but not at the same time. When one device is sending, the other can only receive, and vice versa. The half-duplex mode is used in cases where there is no need for communication in both directions at the same time. The entire capacity of the channel can be utilized for each direction</p> <p>-for example: Walkie-talkies.</p> <div style="text-align: center;">  <p>Half-duplex</p> </div> <p>3. In full-duplex mode both stations can transmit and receive data simultaneously. The transmission medium sharing can occur in two ways,</p>		<p>for each mode 1M for diagram 1M for explanation</p>

	<p>namely, either the link must contain two physically separate transmission paths or the capacity of the channel is divided between signals traveling in both directions .One common example of full-duplex communication is the telephone network. When two people are communicating by a telephone line, both can talk and listen at the same time.</p> <div style="text-align: center;">  <p>The diagram illustrates full-duplex communication between two workstations. A horizontal line connects two computer workstations, each consisting of a monitor, keyboard, and mouse. Above the line, a double-headed pink arrow points in both directions, with the text "Direction of data all the time" written above it. Below the line, the word "Full-duplex" is written in a large, bold, blue font. The word "Workstation" is written below each computer icon.</p> </div>	
<p style="text-align: center;">b</p>	<p style="text-align: center;">Describe the principles of packet switching and circuit switching techniques with neat diagram.</p>	<p style="text-align: center;">6M</p>
<p style="text-align: center;">Ans</p>	<p>Circuit Switching: When two nodes communicate with each other over a dedicated communication path, it is called circuit switching. There 'is a need of pre-specified route from which data will travels and no other data is permitted. In circuit switching, to transfer the data, circuit must be established so that the data transfer can take place.</p> <p>Circuits can be permanent or temporary. Applications which use circuit switching may have to go through three phases:</p> <ul style="list-style-type: none"> ● Establish a circuit ● Transfer the data ● Disconnect the circuit 	<p>Circuit switching-3M 1 M –diagram, 2M explanation: Packet switching-3 M 1M- diagram, 2M explanation</p>

Circuit switching was designed for voice applications. Telephone is the best suitable example of circuit switching. Before a user can make a call, a virtual path between callers and called is established over the network.

Packet Switching: The entire message is broken down into smaller chunks called packets. The switching information is added in the header of each packet and transmitted independently.

It is easier for intermediate networking devices to store small size packets and they do not take much resource either on carrier path or in the internal memory of switches.

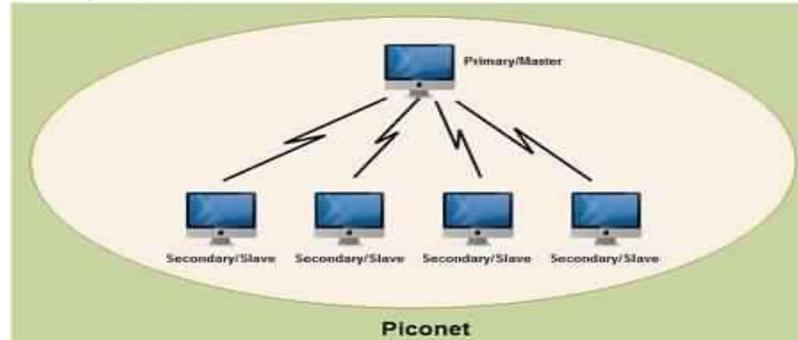

Packet switching enhances line efficiency as packets from multiple applications can be multiplexed over the carrier. The internet uses packet switching technique. Packet switching enables the user to differentiate data streams based on priorities. Packets are stored and forwarded according to their priority to provide quality of service.

	<p>c Explain configuration of TCP/IP protocol in network.</p>	<p>6M</p>
<p>Ans</p>	<p>Before beginning configuration procedure, the following are the prerequisites.</p> <ul style="list-style-type: none"> ● Network hardware is installed and cabled. . ● TCP/IP software is installed. <p>To configure your TCP/IP network, the following steps are followed:</p> <ul style="list-style-type: none"> ● Read TCP/IP protocols for the basic organization of TCP/IP. 	<p>Step by step procedure -6M</p>

		<ul style="list-style-type: none"> ● Minimally configure each host machine on the network. This means adding a network adapter, assigning an IP address, and assigning a host name to each host, as well as defining a default route to your network. For background information on these tasks, refer to TCP/IP network interfaces, TCP/IP addressing, and Naming hosts on your network. ● Configure and start the intend daemon on each host machine on the network. Read TCP/IP daemons and then follow the instructions in Configuring the intend daemon. ● Configure each host machine to perform either local name resolution or to use a name server. If a hierarchical Domain Name networks being set up, configure at least one host to function as a name server. ● If the network needs to communicate with any remote networks, configure at least one host to function as a gateway. The gateway can use static routes or a routing daemon to perform inters network routing. ● Decide which services each host machine on the network will use. By default, all services are available. Follow the instructions in Client network services if you wish to make a particular service unavailable. ● Decide which hosts on the network will be servers, and which services a particular server will provide. Follow the instructions in Server network services to start the server daemons you wish to run. ● Configure any remote print servers that are needed. ● Optional: If desired, configure a host to use or to serve as the master time server for the network. 	
6.		Attempt any Three of the following:	12M
	a	Describe Bluetooth architecture technologies.	6M
	Ans	<p>Bluetooth Architecture</p> <p>Bluetooth architecture defines two types of networks:</p> <ol style="list-style-type: none"> 1. Piconet 2. Scatternet <p>1. Piconet</p> <ul style="list-style-type: none"> • Piconet is a Bluetooth network that consists of one primary (master) node and seven active secondary (slave) nodes. • Thus, piconet can have up to eight active nodes (1 master and 7 slaves) or stations within the distance of 10 meters. • There can be only one primary or master station in each piconet. 	<p>Piconet 3M (1M diagram, 2M for explanation); Scatternet- 3M(1M diagram, 2M for explanation)</p>

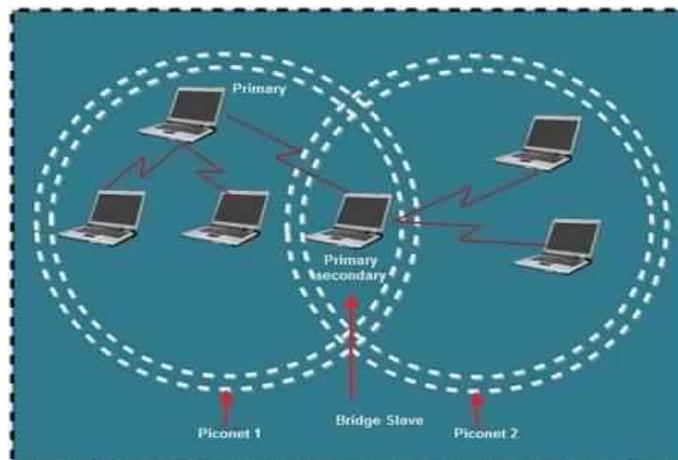

- The communication between the primary and the secondary can be one-to-one or one-to-many.

- All communication is between master and a slave. Slave-slave communication is not possible.
- In addition to seven active slave station, a piconet can have upto 255 parked nodes. These parked nodes are secondary or slave stations and cannot take part in communication until it is moved from parked state to active state.

2. Scatternet

- Scatternet is formed by combining various piconets.
- A slave in one piconet can act as a master or primary in other piconet.
- Such a station or node can receive messages from the master in the first piconet and deliver the message to its slaves in other piconet where it is acting as master. This node is also called bridge slave.
- Thus a station can be a member of two piconets.
- A station cannot be a master in two piconets.

b Explain the process of DHCP server configuration.

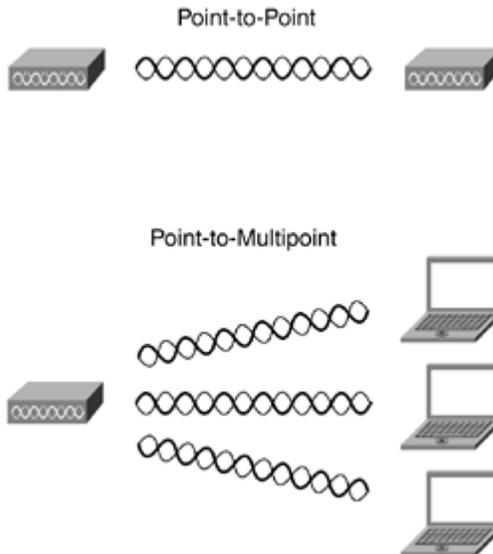

6M

	<p>Ans</p> <p>Configuring the DHCP Server</p> <p>To configure the DHCP server:</p> <ol style="list-style-type: none">1. From the Control Panel, go to Administrative Tools >> Computer Management >> Services and Application >> DHCP.2. From the Action menu, select New Scope. <p>The New Scope wizard is displayed.</p> <ol style="list-style-type: none">3. Enter the following information as prompted:<ul style="list-style-type: none">▪ Scope name and description:▪ IP address range (for example, 192.168.0.170 to 192.168.0.171)▪ Subnet mask (for example, 255.255.255.0)▪ Add exclusions (do not exclude any IP addresses)▪ Lease duration (accept the default of 8 days)▪ Router (default gateway) of your subnet (for example, 192.168.0.1)▪ Domain name, WINS server (these are not needed)▪ Activate Scope? (select “Yes, I want to activate this scope now”)4. Click Finish to exit the wizard. <p>The contents of the DHCP server are listed.</p> <ol style="list-style-type: none">5. Right-click Scope [iP address] scope-name and select Properties.6. In the Scope Properties box, click the Advanced tab.7. Select BOOTP only, set the lease duration to Unlimited, and click OK.8. Right-click Reservations. <p>The Controller A Properties box is displayed.</p> <ol style="list-style-type: none">9. Enter the IP address and the MAC address for Controller A. Click Add. <p>The Controller B Properties box is displayed.</p>	<p>Step by step procedure- 6M</p>
--	---	-----------------------------------

		<p>10. Enter the IP address and the MAC address for Controller B. Click Add.</p> <p>The controllers are added to the right of the Reservations listing.</p> <p>11. Right-click Scope [iP address] scope-name to disable the scope.</p> <p>12. Click Yes to confirm disabling of the scope.</p> <p>13. Right-click Scope and select Activate.</p>	
	c	Describe wireless infrastructure components in detail.	6M
	Ans	<p>Wireless Network Infrastructures</p> <p>The infrastructure of a wireless network interconnects wireless users and end systems. The infrastructure might consist of base stations, access controllers, application connectivity software, and a distribution system. These components enhance wireless communications and fulfill important functions necessary for specific applications.</p> <p>1. Base Stations</p> <p>The base station is a common infrastructure component that interfaces the wireless communications signals traveling through the air medium to a wired network? Often referred to as a distribution system. Therefore, a base station enables users to access a wide range of network services, such as web browsing, e-mail access, and database applications. A base station often contains a wireless NIC that implements the same technology in operation by the user's wireless NIC.</p> <p>Residential gateways and routers are more advanced forms of base stations that enable additional network functions.</p> <p>As show in Figure a base station might support point-to-point or point-to-multipoint communications.</p>	4 components- 11/2M each

Base Stations Support Different Configurations

Access Controllers

In the absence of adequate security, quality of service (QoS), and roaming mechanisms in wireless network standards, companies offer access-control solutions to strengthen wireless systems. The key component to these solutions is an access controller, which is typically hardware that resides on the wired portion of the network between the access points and the protected side of the network. Access controllers provide centralized intelligence behind the access points to regulate traffic between the open wireless network and important resources. In some cases, the access point contains the access control function.

Application Connectivity Software

Web surfing and e-mail generally perform well over wireless networks. All it takes is a browser and e-mail software on the client device. Users might lose a wireless connection from time to time, but the protocols in use for these relatively simple applications are resilient under most conditions.

Special application connectivity software is necessary as an interface between a user's computer device and the end system hosting the application's software or database.

	<p>Distribution System</p> <p>A wireless network is seldom entirely free of wires. The distribution system, which often includes wiring, is generally necessary to tie together the access points, access controllers, and servers. In most cases, the common Ethernet comprises the distribution system.</p>
